Abstract

Hey, this is the abstract of my thesis. It should be a brief summary of the work, highlighting the main objectives, methods, results, and conclusions. The abstract should be concise and informative, allowing readers to quickly understand the essence of the research. **Keywords:** key, word.

Resumo

O teu resumo COOL, its me TEST WOWIEESSS

Palavras-chave: palavra, chave..

Acknowledgements

First of all, I would like to thank my family, etc, etc

Chapter 1

Introduction

In this chapter, the problem is overviewed, the study's importance is explained along with goals for the proposed solution.

1.1 Background

Despite recent advances in [1],

Chapter 2

Preliminaries

Theory builds upon theory, therefore it is essential to establish a solid foundation by understanding the basic concepts and terminology that compose the core topics of formal languages and automata theory. In this chapter we begin by formally defining what a language is and then move on to describe the class of languages known as regular languages. Along the way, we will also introduce various concepts such as finite/non-finite automata and regular expressions.

2.1 Alphabets, Strings and Languages

Alphabets

An *alphabet* is a finite, non-empty set of symbols, typically denoted by the Greek letter Σ . That is,

$$\Sigma = \{a_1, a_2, \dots, a_n\}$$

where each a_i is a symbol in the alphabet.

For example, one can represent the binary alphabet as $\Sigma = \{0, 1\}$, or the English alphabet as $\Sigma = \{a, b, c, \dots, z\}$.

Strings

A *string* over an alphabet Σ is a finite sequence of symbols from Σ . Strings are typically denoted by w , and the *length* of a string w is denoted by $|w|$.

The set of all strings over the alphabet Σ is denoted by Σ^* and defined as:

$$\Sigma^* = \{w \mid w \text{ is a finite sequence of symbols from } \Sigma\}$$

The unique string of length zero is called the *empty string*, denoted by ε . It is important to note that $\varepsilon \in \Sigma^*$.

For example, if $\Sigma = \{0, 1\}$, then we have that:

$$\Sigma^* = \{\varepsilon, 0, 1, 00, 01, 10, 11, 000, 001, 010, 011, 100, 101, 110, 111, \dots\}$$

Where the empty string is, as mentioned above, denoted by ε and also belongs to Σ^* .

Languages

A *language* over an alphabet Σ is a set of strings over Σ .

$$L \subseteq \Sigma^*$$

That is, a language is any subset of Σ^* , possibly infinite, finite, or even empty. Since a language is a set of strings, the following standard set operations can be applied:

- *Intersection:* $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$
- *Union:* $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$
- *Difference:* $A - B = \{x \mid x \in A \text{ and } x \notin B\}$

Furthermore, we can also operate specifically over languages with the following operations:

- *Concatenation:* $L_1 \cdot L_2 = \{xy \mid x \in L_1 \text{ and } y \in L_2\}$
- *Kleene Star:* $L^* = \bigcup_{n=0}^{\infty} L^n$, where $L^0 = \{\varepsilon\}$ and $L^n = L \cdot L^{n-1}$ for $n > 0$.

This operation combines every string

The *complement* of a language L over an alphabet Σ is denoted by \overline{L} and is defined as: This
